## DETAILED ACTION

### *Claim Rejections - 35 USC § 102*

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 15-21 and 25 are rejected under 35 U.S.C. 102(b) as being anticipated by Nashiki US # 5,469,215.

Nashiki teaches that current and voltage applied to the electric motor can be compensated depending on changes in the rotational speed, position and torque of the electric motor, (see column 4, lines 9-13)

In Nashiki a control system comprises a position sensor 8 for sensing the rotational position of 3-phase synchronous motor 7. The position sensor 8 is connected to a speed sensor 5 for sensing a rotational speed based on rotor position and a current command value setting means 13. The speed sensor is connected to a subtracter 1 for subtracting the detected rotational speed from a speed command to determine speed error.

The subtracter 1 is connected to PID compensator 2 for compensating the speed error and to output a torque command value.

The current command value setting means 13 is connected to the memory 61 being compensation storage means for storing torque error compensation data

corresponding to the torque, rotational speed, position, and further to a power amplifier 4 for supplying 3-phase currents that are corresponding to the motor current commands.

As it shown in a block diagram of Fig. 5 Nashiki teaches an adder 12 operative as a motor current preparing means, for preparing motor current amplitude based on torque command and also on torque error compensating data, read out from the memory 61.

The error compensation data stored in memory 61 depends on motor three parameters as shown in Fig. 6, (see column 5, lines 1-56, column 5, lines 16-67).

### ***Claim Rejections - 35 USC § 103***

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 22-24 and 26-28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nashiki US # 5,469,215.

In Nashiki discussion of Fig.9-11 is related to claimed structure and limitations of the above claims. Nashiki teaching can be applied to a control system for a 3-phase ac motor performing two-to-three phase conversion and further to any other control system

for multi-phase, multi-pole motors, dc motors and induction motors, (see column 7, lines 11-67, column 8 – column 9)
